

SYNTHESIS AND REACTIONS OF 3- (O-METHOXYPHENOXY)
-2-HYDROXYPROPYL CHLORIDE

There was a study of interaction of o-methoxyphenol with epichlohydrin. The yield of the product - 3- (o-methoxyphenoxy) -2-hydroxypropyl chloride with the use of BF₃ catalyst is 32%, and pyridine - 57%. In the IR spectrum of this compound, the hydroxyl group absorbs in the region of 3400-3500 cm⁻¹, and the C-Cl bond in the region of 750-780 cm⁻¹.

The acylation reaction with 3- (o-methoxyphenoxy) -2-hydroxypropyl chloride with acetic acid gives 3- (o-methoxyphenoxy) -2-acetoxypropyl chloride.

In the IR spectrum of this compound, the absorption band of the OH group at 3400–3500 cm⁻¹ for the starting compound disappears and the absorption band at 1740–1745 cm⁻¹, characteristic of the carbonyl group, appears. When treating 3- (o-methoxyphenoxy) -2-hydroxypropyl chloride with alkali in dry sulfuric ether, it is converted to 3- (o-methoxyphenoxy) -1,2-epoxypropane.

The absorption bands of the aromatic ring of this compound in the IR spectrum are observed in the region of 1580-1600 cm⁻¹. In the PMR spectrum, proton signals were detected at 6.72 ppm. (protons of aromatic ring, 4H, s.), 3.75 ppm (OCH₃, 3H, s.), 2.70 ppm (CH₂, 2H, m.).
